

Resizing Images in Photoshop

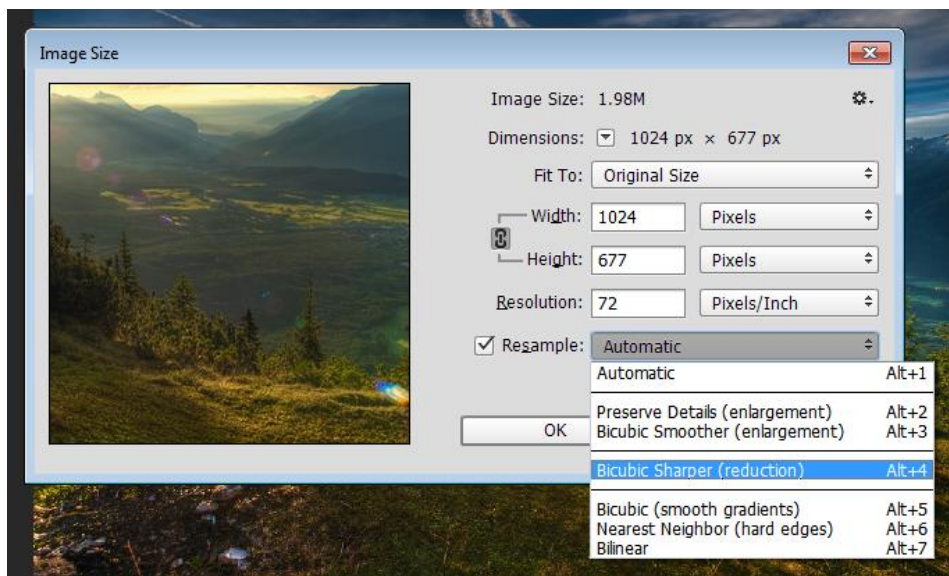

Open an image, click on Image -> Image Size...

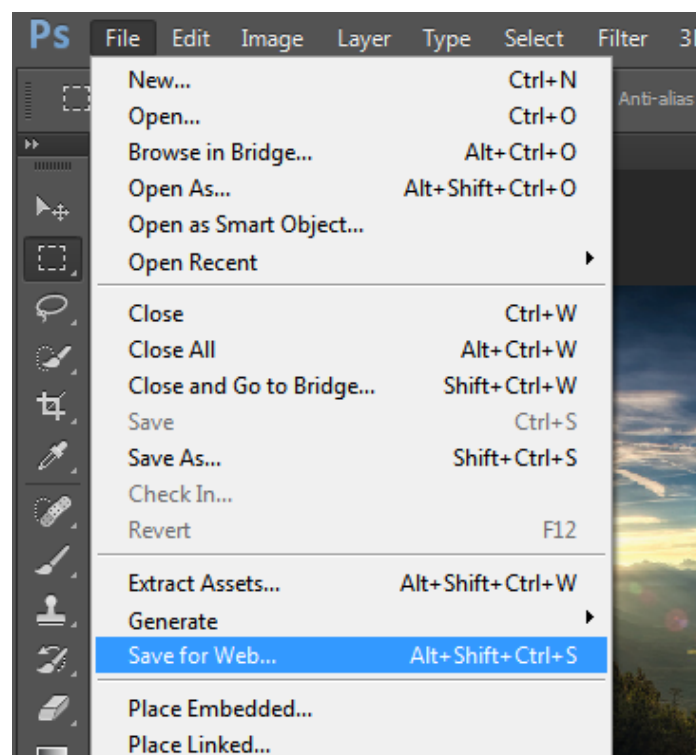

Change the measurements to pixels (if that isn't the default).

Select a new size.

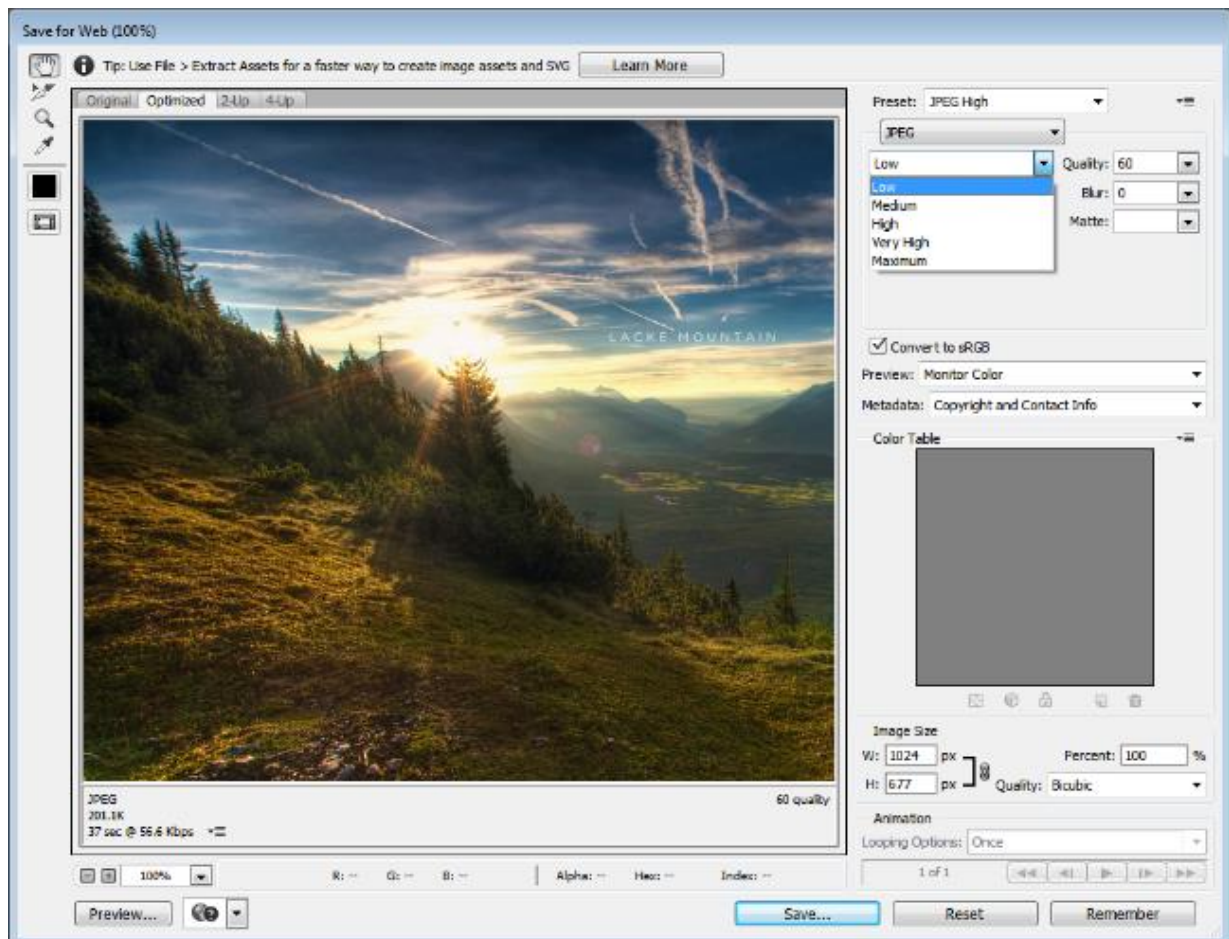

Select a resampling algorithm from the drop down menu (you don't need to know about the technical names yet, but you should be able to make a choice based on the descriptive term).

Next, go to the File menu and choose Save for Web...

This opens up a dialog box that lets you choose a file type and compression level.

For now, choose JPEG and then a quality level. Try and keep the quality level as low as you can without noticeable problems with the image appearing:

Then hit Save, and make sure to give it a sensible file name!
